don't talk to strangers

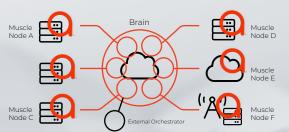

reflex \Lambda

adaptive 🔨

Next Generation ZTC SASE

Proactively deny connections of all potential threats while intelligently remaining connected to all that is good and necessary.

- Neutralize Ransomware, Zero Days & Evasion Threats BEFORE detection.
- Exfiltration of Classified Data & IP theft stopped BEFORE attacks can execute.
- Phishing Vector Closed by default. Effectively mitigate the Human Factor.
- IoT | IIoT | MIoT | OT | ICS | CI protected. No agent required.
- Sovereign Data Custody. Decentralized resilience.
- Resolve Shadow IT. Automatic Device Quarantine. Full Layer2 Visibility.
- M-22-09 easily fulfilled across all devices and environments with minimal disruption.

How adam:ONE® works

At the core, adam:ONE® is a highly optimized DNS caching resolver that lives on top of a firewall engine in a Muscle - Brain hybrid configuration: Gaining the resilience of a distributed deployment and the benefit of centralized control. Out-of-band protection means its protection is applicable to all types of devices including OT, IoT and IT with no endpoint agent required. The Muscle can be applied to a flexible edge on-premise or in-cloud at any point between the endpoint and its connection to the Universal Threat Ecosystem (a.k.a.: the Internet). A cloud controller (Brain) is used for orchestration and controls.

- 1. Starting in a Default-Deny-All state, by the use of aggregated intelligence merged with Al driven dynamic allowlisting, a dynamic policy is written as a device needs to access verified connections to web services.
- 2. To be able to use DNS as a functional root of trust, it enforces our patented technology called Don't Talk to Strangers (DTTS)® that denies all IP connections by default, unless first requested by DNS and allowed by the dynamic policy.
- 3. If allowed by policy, it opens a hole to establish the verified connection, and then collapses it as soon as the connection expires.

Allowed connections are cross-checked by DNSharmony® aggregation of protective DNS resolvers of your choice. This aggregates threat intelligence in real-time for enhanced performance and creates resilience beyond the standard single resolver set.

Any Device

The net result: Zero Trust connectivity for any device requesting connection through adam:ONE®. ZT protection invisible to the user.
